

Request-to-exit button with key icon, surface-mount, 61 mm square

www.boschsecurity.com

BOSCH
Invented for life

Surface-mounted device in white, with key icon.

System overview

A request-to-exit button unlocks a door for a person without credentials. It typically permits egress even if ingress requires credentials.

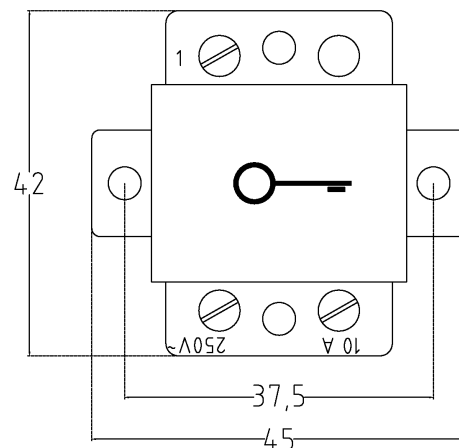

Functions

1. Operating current function (fail-locked):
The door mechanism requires power to unlock. The door remains locked in the event of a power failure.
2. Standby function (fail-open):
The door mechanism requires power to lock. The door can be pushed open in the event of a power failure.
3. Sensor contact:
Door openers may have a zero-potential contact that senses whether the door is open or closed. This contact can be used by access control systems.
4. Latch adjustment:
A door opener with FaFix has adjustable parts that can be re-aligned after installation. Heat expansion may be compensated easily by adjusting the alignment.

- ▶ The door openers may only be operated with direct current corresponding to the nominal voltage. Continuous contact (100% duty cycle) is possible.
- ▶ Zero-potential sensor contact for signaling whether the door is open or closed.
- ▶ Suppressor diode to counteract voltage spikes during the switching process.

Installation/configuration notes

Surface mounted, not recessed.

Parts included

The Request-to-Exit button as illustrated, without accessories.

Technical specifications

Dimensions (H x W x D)	61 mm x 61 mm x 23 mm
Voltage / current	12 V/1 A
